Introduction

Aspiring AI engineer currently pursuing an MS in Artificial Intelligence at the University at Buffalo. Skilled in Python, PyTorch, NLP, and data analysis, with hands-on experience in developing machine learning models for real-world applications. Passionate about AI research and building impactful, data-driven solutions.

Education

University at Buffalo, SUNY, MS in Artificial Intelligence 2025 – May 2026 (Expected)

- Developed skills in neural network design, data analysis, and PyTorch through team projects. Led collaborative efforts to build and optimize neural models for predictive tasks, managing data workflows and team coordination to deliver results on time.
- Coursework: Basics of AI, Intro to ML, Numerical methods for computing and data science, Data Intensive Computing.

Jaypee Institute of Information Technology (JIIT), Noida, Sec-62, B.Tech in Information Technology 2020 – 2024

- Developed skills in problem solving, leadership, time management, product planning, solution delivery, and cross-team collaboration over four years of engineering.
- Coursework: Data Mining, Web Algorithms, Information Retrieval, Machine Learning, Big Data.

Delhi Public School (DPS), Dwarka, High School 2018 – 2020

- Subjects: Physics, Chemistry, Mathematics, Computer Science.

Experience

Data Science Intern, ECHO India Jun 2023 – Jul 2023

- Collaborated with senior data scientists and analysts to collect, clean, and preprocess large datasets from diverse sources.
- Created insightful visualizations to convey complex findings using Plotly, Seaborn, and Matplotlib.
- Performed natural language processing (NLP) tasks, developing a sentiment analyzer using VADER lexicon to analyze user feedback.

Certifications

Supervised Machine Learning: Regression and Classification Issued Nov 2024

- Learned about regression for predictive numerical analysis and classification for accurate data categorization for robust decision-making in diverse applications.
- *Online Course by Stanford, DeepLearning.AI (Credential).*

Affective Computing Issued May 2024

- Gained skills in emotion recognition, computational modeling of emotions, and analysis of multimodal data (voice, facial expressions, physiological signals) using machine learning and signal processing techniques.
- Developed an understanding of ethical, legal, and social implications in human-machine interaction.
- *Online Course by NPTEL, IIIT-D (Credential).*

Projects

Healthcare Platform for Continuity of Care

- Led the ideation and development of a platform to improve continuity of care and early disease detection for doctors and patients. Our efforts led the idea to the final stage.

Multi Modal Genre Prediction

- The Multi-Modal Genre Classification project aims to improve movie genre prediction by combining textual data (plot summaries) and visual data (movie posters). Using a dataset of over 100,000 movies sourced from TMDb API, the team balanced six main genres through cleaning, augmentation, and undersampling.
- Three models were developed: a Text-only LSTM classifier, an Image-only MLP classifier, and a Fusion model that integrates both modalities using a multi-layer neural network.
- Results show that multi-modal learning significantly enhances genre classification performance.

Taxi Hotspot Detection

- Developed a machine learning model for hotspot detection using taxi trajectories with the ST-DBSCAN algorithm.
- Aimed to reduce wait times for both taxi drivers and riders.

Sentiment Analyzer

- Developed a sentiment analyzer using the Naïve Bayes algorithm to categorize Google reviews as positive or negative.

Multi-Disease Prediction Web App

- Developed a machine learning web app to predict multiple diseases, including Parkinson's disease, heart disease, and diabetes.

Co-Curricular Activities

Light De Literacy NGO

Oct 2020 – 2024

- Taught underprivileged children and contributed to their health and well-being.
- Served as Admissions Head, facilitating the admission process for children.
- Organized fundraising activities, led cloth donation drives, and coordinated cultural events.

BitBox Hackathon

Mar 2021

- Selected among the top 20 teams.

Technologies

Languages: C++, Python

Technologies: Machine Learning, ST-DBSCAN, Naïve Bayes, Plotly, Seaborn, Matplotlib, VADER, Neural Networks, Data Analysis, Pytorch
